

Expanded SDLC & Agile Notes (Extracted from PPT)

Slide 1

Software Development Life Cycle (SDLC) & Agile Methodology

Expanded Explanation:

SDLC is a structured framework used to develop software from inception to retirement. It improves planning, quality, risk management, communication, and maintenance. Example: In an online banking project, requirements are collected, architecture is designed, code is developed, tested, deployed, and maintained.

Slide 2

SDLC Fundamentals

Expanded Explanation:

SDLC is a structured framework used to develop software from inception to retirement. It improves planning, quality, risk management, communication, and maintenance. Example: In an online banking project, requirements are collected, architecture is designed, code is developed, tested, deployed, and maintained.

Slide 12

SDLC Models

Expanded Explanation:

SDLC is a structured framework used to develop software from inception to retirement. It improves planning, quality, risk management, communication, and maintenance. Example: In an online banking project, requirements are collected, architecture is designed, code is developed, tested, deployed, and maintained.

Slide 25

Agile & Scrum

Expanded Explanation:

Agile delivers software incrementally through short iterations called sprints. Teams collaborate with customers, respond to change, and continuously improve through retrospectives.

Slide 42

SDLC vs Agile Activity

Expanded Explanation:

SDLC is a structured framework used to develop software from inception to retirement. It improves planning, quality, risk management, communication, and maintenance. Example: In an online banking project, requirements are collected, architecture is designed, code is developed, tested, deployed, and maintained.

Slide 44

DevOps & CI/CD

Expanded Explanation:

DevOps integrates Development and Operations using automation. A typical CI/CD pipeline includes Git, Build, Unit Testing, Static Analysis, Packaging, Deployment, Monitoring, and

Feedback.
